

NOTINO - Assignment

Your assignment is to create an application for displaying a couple of Notino products as seen in the example screenshot below.

Fetch products using a simple **GET** request at URL – <https://my-json-server.typicode.com/cernfr1993/notino-assignment/db>

Prefix URL for downloading product images – https://i.notino.com/detail_zoom/{IMAGE_ID}

You may use any 3rd party library but be prepared to explain the reason why.

Required:

- Create **native iOS** application in **Xcode** using **Swift**.
- Both UIKit and SwiftUI are valid options, but please stay away from storyboards and xibs.
- Use the provided vector assets.
- Use score property in reviewSummary for displaying correct product rating.
- Clicking on the heart button should toggle its image between ic_heart_empty and ic_heart_fill assets.
- Use prefix url for downloading product images https://i.notino.com/detail_zoom/
- Keep in mind that products count can be much higher than provided in example request.

Optional:

- Persist wishlisted products (those with a red heart) across app launches.
